

Amendments to the Specification:

Please add the following new paragraph after the paragraph ending at page 7, line 2:

-- Figure 6, a top view of a round brush head configured for oscillating rotational movement.--

Please add the following new paragraph after the paragraph ending at page 11, line 34:

-- Figure 6 depicts a top view of an oscillating round brush head 50 configured for oscillating rotational movement. Brush head 50 includes a plurality of depressions 51 extending a short distance from an outer edge of the brush head. The depressions 51 are tapered off outwardly along a radial direction. Brush head 50 includes bristle clusters 53 protruding from depressions 51 and bristle clusters 55 not surrounded by the depressions and protruding between two adjacent depressions. The bristle clusters 53 and 55 have a rectangular cross section and define a pair of side walls of major and minor extent. The walls of major extent are disposed in a circumferential direction of the brush head and are each at the same distance from the edge. The bristle clusters 53 protruding from the depressions have a greater length than those of the adjacent bristle clusters 55.--
